

The Clovi Platform

Clovi provides a modern and engaging digital platform for health promotion companies to measure, understand and act to prevent chronic diseases.

Scheduler

Health screenings
Health risk assessments
Flu clinics

Understand

Aggregate reports
Individual reports
Risk stratification

Act

Health education
Health coaching
Lifestyle modification
Disease management

Clovi provides web and mobile apps across all three touch points, creating an end-to-end outcomes platform.

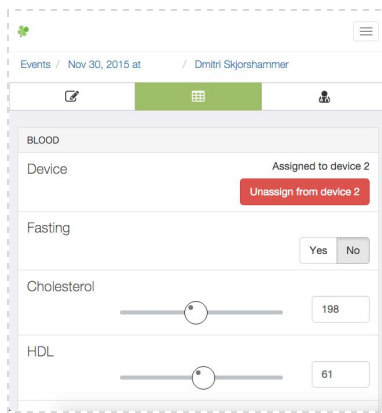

For employees, Clovi provides web and mobile apps for all health screening needs. This includes appointment scheduling, digital consent, Health Risk Assessment, and visual results reporting.

If you already have a scheduling system or HRA in place, we provide intuitive Excel upload functionality to match appointments and HRA information in our system.

For screeners, Clovi provides an intuitive web and mobile app for event management and data collection. Data is securely sent, over SSL, to Clovi's HIPAA-compliant cloud servers.

Once a measurement is saved, Clovi provides real-time feedback on the individual risk ranges, allowing the screener to offer instant, personalized feedback to the participant.

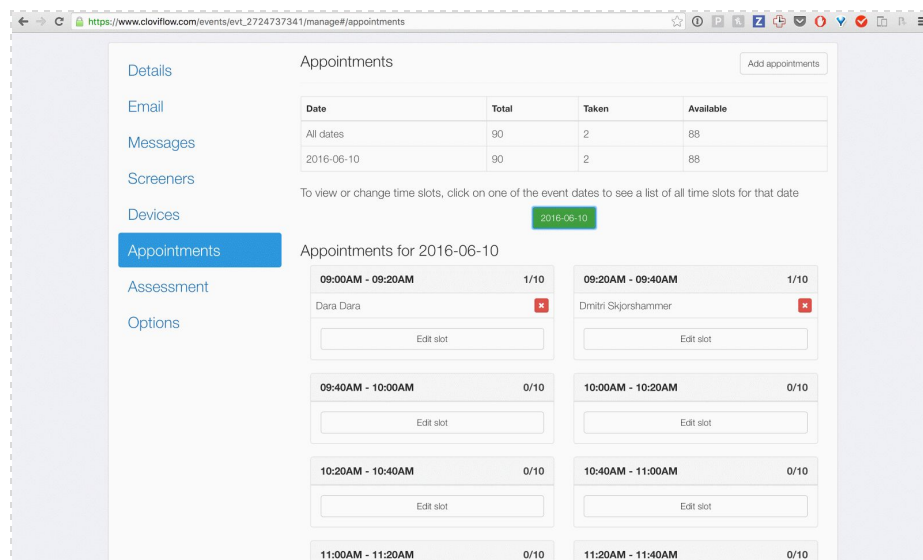

The screenshot shows a mobile app interface for data collection. At the top, it displays 'Events / Nov 30, 2015 at / Dmitri Skjorshammer'. Below this is a 'BLOOD' section with fields for 'Device' (Assigned to device 2), 'Fasting' (Yes/No), 'Cholesterol' (198), and 'HDL' (61). There are sliders for Cholesterol and HDL.

The screenshot shows a mobile app interface for data collection. At the top, it displays 'BLOOD PRESSURE AND HEART RATE'. Below this are fields for 'SYSTOLIC' (140 mmHg), 'DIASTOLIC' (78 mmHg), and 'HEART RATE' (BPM). It provides feedback: 'Falls into Stage 1 Hypertension range' for systolic and 'Falls into Desirable range' for diastolic. A 'Save' button is visible.

Eligibility files can be uploaded prior to the event with 100% matching. After the event, collected data can be exported into Excel or integrated, via RESTful APIs, to third party wellness portals. We also provide ability to instantly print results or email.

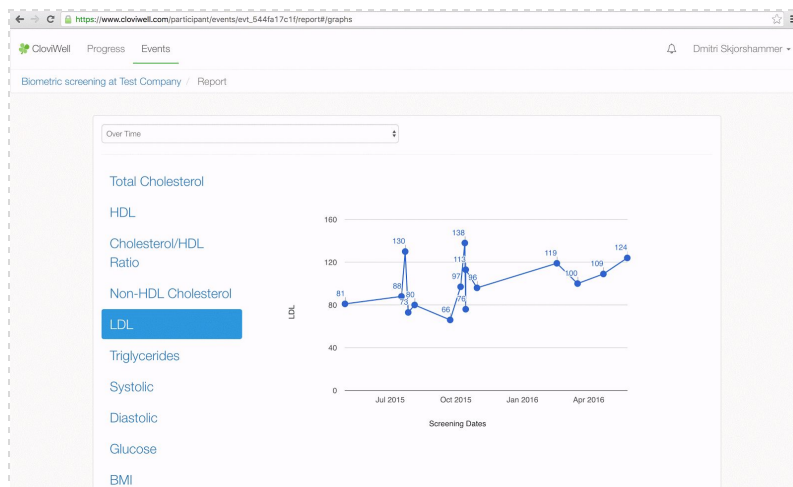

The screenshot shows a web interface for event management. On the left is a sidebar with links: Details, Email, Messages, Screeners, Devices, Appointments (selected), Assessment, and Options. The main area is titled 'Appointments' and shows a table with columns: Date, Total, Taken, and Available. Below the table, it says 'To view or change time slots, click on one of the event dates to see a list of all time slots for that date'. A date selector shows '2016-06-10'. Below this, it shows 'Appointments for 2016-06-10' with a grid of time slots (09:00AM - 09:20AM, 09:20AM - 09:40AM, etc.) and the number of appointments taken/available for each slot.

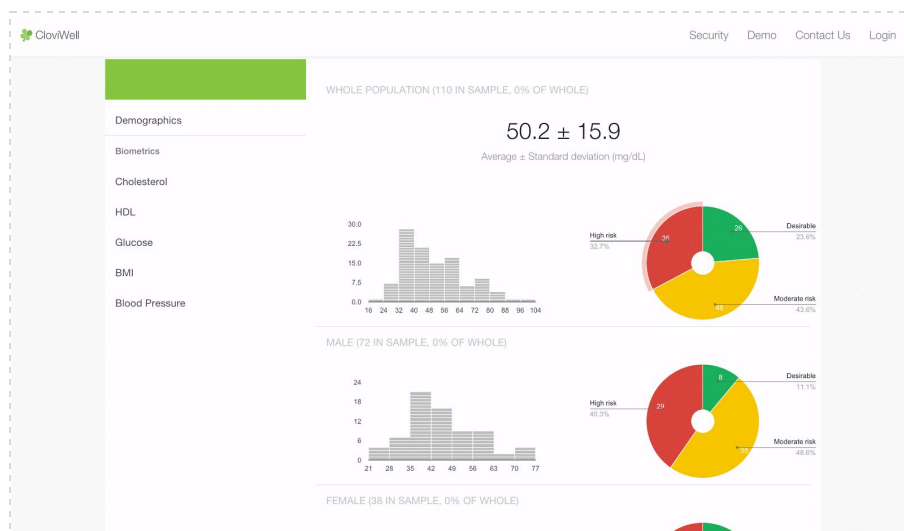

CloviWell - product for end-users

Once the data is collected, it's vital to communicate the results to employees and employers.

For employees, Clovi provides instant real-time results in the web and mobile app. The results are color-coded according to well-defined risk ranges, associated with educational material, and personalized with notes from the screener. If this is a returning employee, their historical test results will be available and comparable to current results.

For employers, Clovi provides instant real-time aggregate reports that are specific to an event, as well as over-time. The employer can filter and sort by specific metrics to get actionable insights from the data.

Security & Privacy

Clovi is a HIPAA-compliant cloud software platform built and run by engineers who believe security is our core business value. When talking about security and privacy, we break the conversation into four stages:

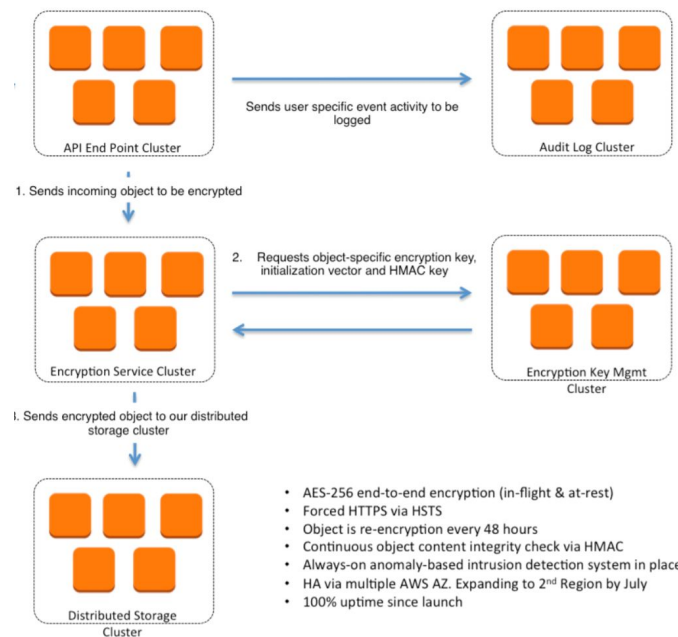

Encryption/Decryption

All communication with Clovi goes through HTTPS. Our servers are only available via HTTPS.

Our HIPAA servers encrypt all records with 256-bit AES encryption keys. Every record is encrypted with a unique initialization vector by a unique encryption key to achieve semantic security. Clovi verifies each record's integrity on a regular basis and on each record request using a hash-based authentication code (HMAC) calculated using its own unique 256-bit HMAC key. Encryption keys, initialization vectors and HMAC keys are rekeyed and each record re-encrypted on a regular basis.

Network Storage

Clovi's HIPAA infrastructure comprises multiple VPN and VPC subsystems. Each subsystem is totally and completely segmented from one another by software and network security rules to maximize protection. Each subsystem can only be accessed by another subsystem via specific network routes and specific inbound and outbound port rules. Below, we share a diagram of the infrastructure.

Transparency and Compliance

Clovi is Safe Harbor Compliant for both US-EU and US-Swiss standards, and is HIPAA compliant. Our products regularly undergo rigorous 3rd-party audits and penetration tests.

Infrastructure and Physical Security

Clovi products run on Amazon Web Services in a secure facility with active monitoring, total system logging, and security including ISO 27001, and other leading physical security measures.
